Binary search questions and answers

Correct: correct answer: the search is a search process of a particular element between different data elements. Research is successful if you find the requested element. Otherwise, research is not successful. Search algorithms- search algorithms are a family of algorithms used for research purposes. The search for an element of the date matrix can be carried out in the following two Linear Search Binary Search in this article, will discuss on Binary search algorithm. Binary Search-Binary Search is one of the fastest search algorithms. It is used to find the position of an element in a linear array. It works according to the principle of divide et impera technique. Binary Search Algorithm can only be applied on ordered arrays. Thus, the elements must be arranged in or increasing if the elements are numbers. Or dictionary order if the elements are strings. To apply binary search on an unordered array, first, order the array using some sorting technique. Then use binary search algorithm. Even read-linear search binary search algorithm - considerations there is a linear array to aa of the size to na. Binary search algorithm is used to search for an item, in this linear array. If you search you successfully, sets loc to the element index otherwise sets loc a -1. Mendico and fine variables records the first index and the last element of the matrix or sub matrix in which the element is searched at that moment. MetA Variable records the index of the central element of this matrix or sub matrix in which the element is searched at that moment. Then, binary search algorithm is the following - begin set beg = 0 end end = n-1 set mid = (beg + end) / 2, while ((beg
